

ABSTRACT

An automatically data delivering system including a server and a mobile communication device is disclosed. The server stores a plurality of pieces of data, from which a piece of data is selected in response to a data request received from the mobile communication device. The selected piece of data is transmitted back to the mobile communication device.

The mobile communication device transmits the data request to the server depending on a user-designated time condition. When the selected piece of data is downloaded from the server, the downloaded piece of data is stored in the memory and is reproduced by a display and a speaker.
